

Experiment-2

Student Name: Anuj Mehta

Branch: CSE

Semester: 6th

Subject Name: System Design

UID: 23BCS13459

Section/Group: KRG_3B

Date of Performance: 14/01/26

Subject Code: 23CSH-314

1. **AIM :** To design an online E-commerce platform similar to Amazon/Flipkart for browsing and purchasing products like mobiles, laptops, cameras, and clothes.
To implement Kafka, Elasticsearch, and a CDC pipeline for real-time data processing, fast search, and scalability.

2. **Objective:**

- To develop a scalable online shopping system for product listing, search, and order management.
- To use Apache Kafka for real-time event streaming and inter-service communication.
- To implement Elasticsearch for fast and efficient product search.
- To integrate a CDC pipeline for real-time synchronization between databases and services.

3. **Tools Required:**

- Programming Language: Java / Python / JavaScript
- Backend Framework: Spring Boot / Express.js / Flask
- Database: MySQL / PostgreSQL / MongoDB
- API Testing Tool: Postman
- Design Tool: Draw.io (for HLD diagrams)
- Web Browser
- ElasticSearch
- Kafka
- CDC connector

4. **SYSTEM DESIGN / SYSTEM SPECIFICATION:**

4.1. **Functional Requirements:**

- User should be able to search and find the products based on product title or names.
- User should be able to view the details of the product like description, image, available quantity, review, accessed.
- User should be able to select the quantity and move the product/item into the cart.
- User should be able to make the payment and should be able to perform the check out.
- User should be able to check the status of the order.
- System should be able to manage purchase of items having limited stocks.

4.2. Non-functional Requirements:

- Target Scale: 100Million DAU with 10 orders processed per second. Availability – System should be available 24/7
- Consistency & Availability: Here for this system we need both as per the Target Scale. Now we should specify that, which part of our system needs what?
- Latency: Required: ~200 ms
- Scaling: Horizontal / Vertical Consistency

4.3. Core-Entities of the System:

1. User / Client
2. Product
3. Cart
4. Orders
5. Checkout followed by Payment

4.4. API Endpoints Creation:

1. GET API Call: Prod_Search

Https://Local_Host/products/search_item = {Search_keywords}

HTTP Req

```
{  
  GET: <iPhone 16>  
}
```

HTTP Res

```
{  
  <ProductID:iPhone>  
}
```

Now, on front-end if multiple data of respective product is coming in that case the FE becomes faulty -> ultimately increasing the LATENCY.

For that: we can use Pagination 1, 2 ,3 ,4 ,----- SO ON

2 GET API Call: View Product Details

Https://Local_Host/products/{product_id}

HTTP Req

```
{  
  GET: <Product_id = 17>  
}
```

HTTP Res

```
{  
  Product_id:17,  
  Name: iPhone 17,  
  Color: Navy Blue,  
  Price: $1099,  
  Image Thumbnail: URL Image
```

3. POST API Call: Item add in cart

Https://Local_Host/cart/add_products

HTTP Req

```
{  
  Product_id = 17,  
  Product_id = 16  
}
```

HTTP Req Header

```
{  
  User_id: 04  
}
```

HTTP Res

```
{  
  Cart_id: 101  
}
```

4. PUT API Call: To update any order in the cart

Let's Suppose you want to add one more product into the cart.

5. DELETE API Call: To remove any item from the cart

Let's Suppose you want to delete one more product into the cart.

6. POST API Call: for check out & Payment

Https://Local_Host/checkout -> {post body}

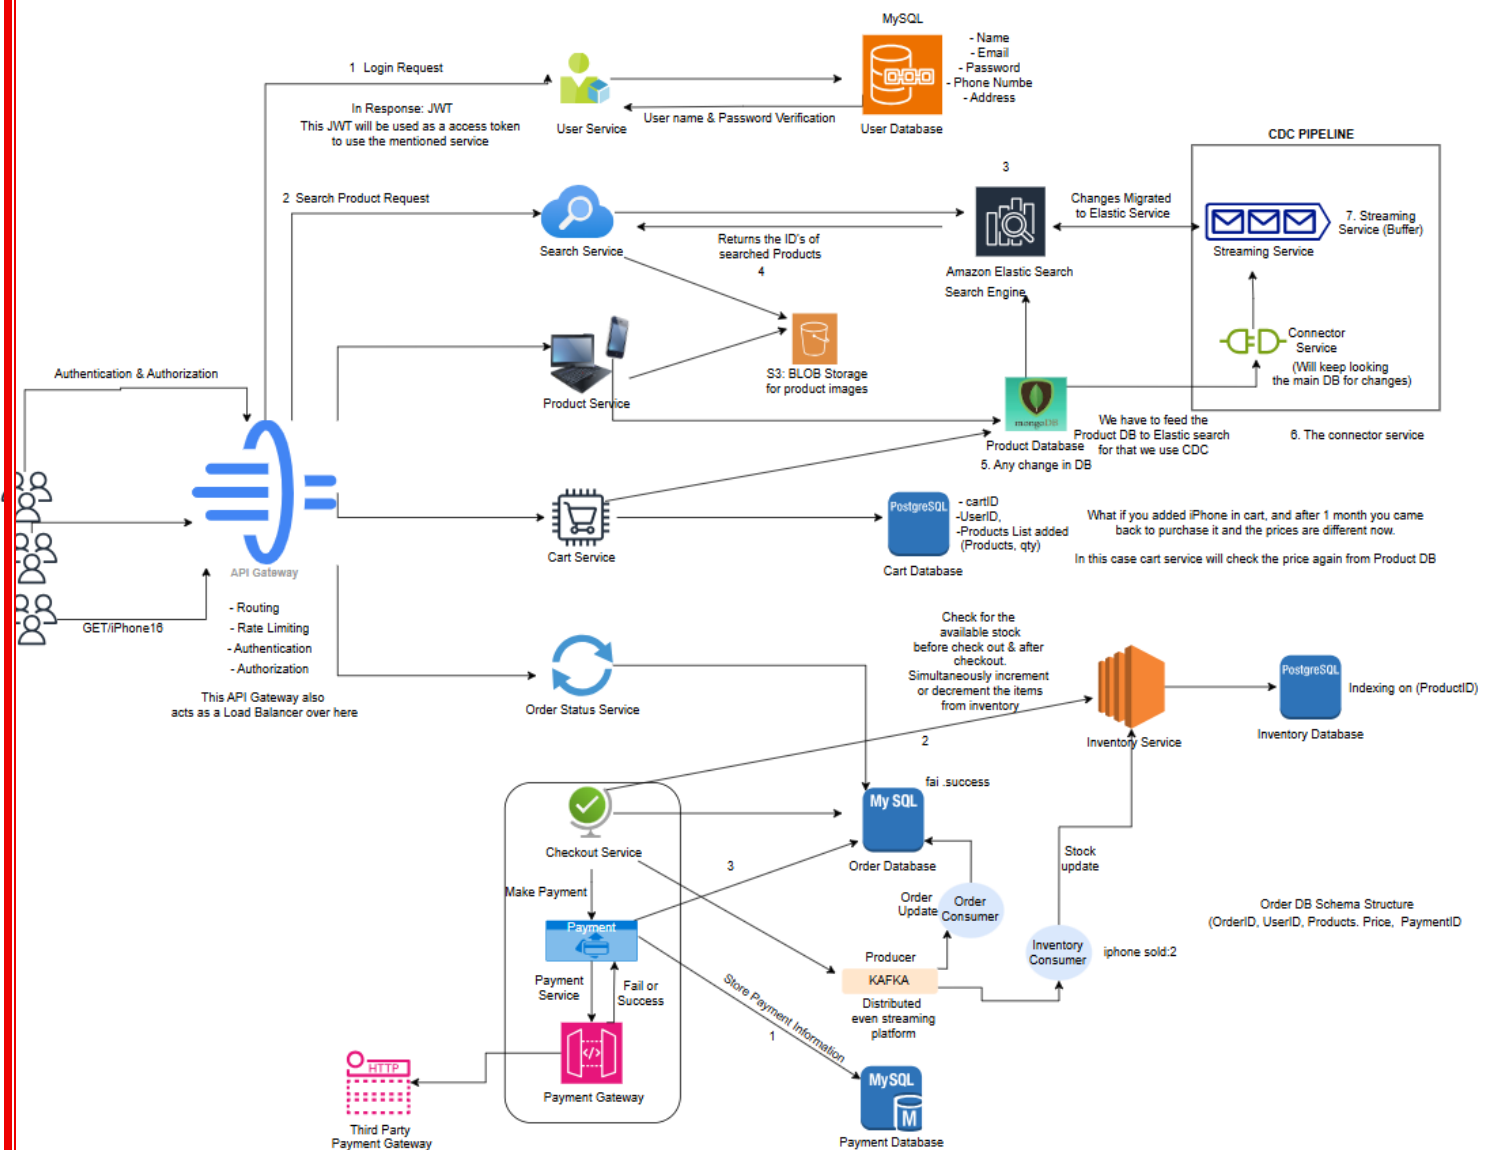

HTTP REQ

```
{  
  All products ID's,  
  Total Quantity,  
  Total Price  
}
```

HTTP RES

```
{  
  Order_ID  
}
```

5. HLD(High Level Design):

6. Learning Outcomes

- Understand the design and architecture of a scalable E-commerce platform.
- Gain hands-on experience with Apache Kafka for real-time data streaming.
- Learn to implement fast and efficient search using Elasticsearch.
- Understand Change Data Capture (CDC) pipelines for real-time data synchronization.
- Develop skills in integrating distributed systems for high availability and scalability.
